

# MINI - EXIT TEST -1

## *NoteSync Application*

### Setting Up the Application:

1. Begin by establishing a MySQL database named "resultDatabase"
2. Import the Java backend, labeled as "backend/NoteSync" into your development environment, such as STS or Eclipse. Execute the backend to initialize the system.
3. Launch the Angular frontend, known as "frontend/NoteSync," within your preferred code editor, such as VS Code.
4. In your terminal, execute the following commands:
  - *Run "npm install" to install necessary dependencies.*
  - *Start the application with "ng serve."*
5. Access and utilize the application by navigating to "http://localhost:4200/."

#### --Functionalities of the Application:

This system empowers users with the following capabilities:

- Create new notes.
- Modify existing notes.
- Access and review recently edited notes.
- Remove unwanted notes from the system.
